02 INFORMATION ABOUT PRINCIPAL INVESTIGATORS/PROJECT DIRECTORS(PI/PD) and co-PRINCIPAL INVESTIGATORS/co-PROJECT DIRECTORS

Submit only ONE copy of this form **for each PI/PD and co-PI/PD** identified on the proposal. The form(s) should be attached to the original proposal as specified in GPG Section II.B. Submission of this information is voluntary and is not a precondition of award. This information will not be disclosed to external peer reviewers. *DO NOT INCLUDE THIS FORM WITH ANY OF THE OTHER COPIES OF YOUR PROPOSAL AS THIS MAY COMPROMISE THE CONFIDENTIALITY OF THE INFORMATION*.

PI/PD Name: Ethan Schreier		
Gender:	\boxtimes	Male
Ethnicity: (Choose one response)		Hispanic or Latino 🛛 Not Hispanic or Latino
Race:		American Indian or Alaska Native
(Select one or more)		Asian
		Black or African American
		Native Hawaiian or Other Pacific Islander
	\boxtimes	White
Disability Status:		Hearing Impairment
(Select one or more)		Visual Impairment
		Mobility/Orthopedic Impairment
		Other
	\boxtimes	None
Citizenship: (Choose one)	\boxtimes	U.S. Citizen Dermanent Resident Other non-U.S. Citizen
Check here if you do not wish to prov	ide an	y or all of the above information (excluding PI/PD name):
REQUIRED: Check here if you are cur project ⊠	rently	serving (or have previously served) as a PI, co-PI or PD on any federally funded
Ethnicity Definition: Hispanic or Latino. A person of Mexica of race.	n, Pue	erto Rican, Cuban, South or Central American, or other Spanish culture or origin, regardless

Race Definitions:

American Indian or Alaska Native. A person having origins in any of the original peoples of North and South America (including Central America), and who maintains tribal affiliation or community attachment.

Asian. A person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent including, for example, Cambodia, China, India, Japan, Korea, Malaysia, Pakistan, the Philippine Islands, Thailand, and Vietnam.

Black or African American. A person having origins in any of the black racial groups of Africa.

Native Hawaiian or Other Pacific Islander. A person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands.

White. A person having origins in any of the original peoples of Europe, the Middle East, or North Africa.

WHY THIS INFORMATION IS BEING REQUESTED:

The Federal Government has a continuing commitment to monitor the operation of its review and award processes to identify and address any inequities based on gender, race, ethnicity, or disability of its proposed PIs/PDs. To gather information needed for this important task, the proposer should submit a single copy of this form for each identified PI/PD with each proposal. Submission of the requested information is voluntary and will not affect the organization's eligibility for an award. However, information not submitted will seriously undermine the statistical validity, and therefore the usefulness, of information recieved from others. Any individual not wishing to submit some or all the information should check the box provided for this purpose. (The exceptions are the PI/PD name and the information about prior Federal support, the last question above.)

Collection of this information is authorized by the NSF Act of 1950, as amended, 42 U.S.C. 1861, et seq. Demographic data allows NSF to gauge whether our programs and other opportunities in science and technology are fairly reaching and benefiting everyone regardless of demographic category; to ensure that those in under-represented groups have the same knowledge of and access to programs and other research and educational oppurtunities; and to assess involvement of international investigators in work supported by NSF. The information may be disclosed to government contractors, experts, volunteers and researchers to complete assigned work; and to other government agencies in order to coordinate and assess programs. The information may be added to the Reviewer file and used to select potential candidates to serve as peer reviewers or advisory committee members. See Systems of Records, NSF-50, "Principal Investigator/Proposal File and Associated Records", 63 Federal Register 267 (January 5, 1998), and NSF-51, "Reviewer/Proposal File and Associated Records", 63 Federal Register 267 (January 5, 1998), and NSF-51, "Reviewer/Proposal File and Associated Records", 63 Federal Register 267 (January 5, 1998).

Certification for Authorized Organizational Representative or Individual Applicant:

By signing and submitting this proposal, the Authorized Organizational Representative or Individual Applicant is: (1) certifying that statements made herein are true and complete to the best of his/her knowledge; and (2) agreeing to accept the obligation to comply with NSF award terms and conditions if an award is made as a result of this application. Further, the applicant is hereby providing certifications regarding debarment and suspension, drug-free workplace, and lobbying activities (see below), nondiscrimination, and flood hazard insurance (when applicable) as set forth in the NSF Proposal & Award Policies & Procedures Guide, Part I: the Grant Proposal Guide (GPG) (NSF 08-1). Willful provision of false information in this application and its supporting documents or in reports required under an ensuing award is a criminal offense (U. S. Code, Title 18, Section 1001).

Conflict of Interest Certification

In addition, if the applicant institution employs more than fifty persons, by electronically signing the NSF Proposal Cover Sheet, the Authorized Organizational Representative of the applicant institution is certifying that the institution has implemented a written and enforced conflict of interest policy that is consistent with the provisions of the NSF Proposal & Award Policies & Procedures Guide, Part II, Award & Administration Guide (AAG) Chapter IV.A; that to the best of his/her knowledge, all financial disclosures required by that conflict of interest policy have been made; and that all identified conflicts of interest will have been satisfactorily managed, reduced or eliminated prior to the institution's expenditure of any funds under the award, in accordance with the institution's conflict of interest policy. Conflicts which cannot be satisfactorily managed, reduced or eliminated must be dislosed to NSF.

Drug Free Work Place Certification

By electronically signing the NSF Proposal Cover Sheet, the Authorized Organizational Representative or Individual Applicant is providing the Drug Free Work Place Certification contained in Exhibit II-3 of the Grant Proposal Guide.

Debarment and Suspension Certification (If answer "yes", please provide explanation.)

Is the organization or its principals presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from covered transactions by any Federal department or agency?

By electronically signing the NSF Proposal Cover Sheet, the Authorized Organizational Representative or Individual Applicant is providing the Debarment and Suspension Certification contained in Exhibit II-4 of the Grant Proposal Guide.

Certification Regarding Lobbying

The following certification is required for an award of a Federal contract, grant, or cooperative agreement exceeding \$100,000 and for an award of a Federal loan or a commitment providing for the United States to insure or guarantee a loan exceeding \$150,000.

Yes 🗖

No 🛛

Certification for Contracts, Grants, Loans and Cooperative Agreements

The undersigned certifies, to the best of his or her knowledge and belief, that:

(1) No federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan, or cooperative agreement.

(2) If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure of Lobbying Activities," in accordance with its instructions.

(3) The undersigned shall require that the language of this certification be included in the award documents for all subawards at all tiers including subcontracts, subgrants, and contracts under grants, loans, and cooperative agreements and that all subrecipients shall certify and disclose accordingly.

This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by section 1352, Title 31, U.S. Code. Any person who fails to file the required certification shall be subject to a civil penalty of not less than \$10,000 and not more than \$100,000 for each such failure.

Certification Regarding Nondiscrimination

By electronically signing the NSF Proposal Cover Sheet, the Authorized Organizational Representative is providing the Certification Regarding Nondiscrimination contained in Exhibit II-6 of the Grant Proposal Guide.

Certification Regarding Flood Hazard Insurance

Two sections of the National Flood Insurance Act of 1968 (42 USC §4012a and §4106) bar Federal agencies from giving financial assistance for acquisition or construction purposes in any area identified by the Federal Emergency Management Agency (FEMA) as having special flood hazards unless the:

community in which that area is located participates in the national flood insurance program; and
 building (and any related equipment) is covered by adequate flood insurance.

By electronically signing the NSF Proposal Cover Sheet, the Authorized Organizational Representative or Individual Applicant located in FEMA-designated special flood hazard areas is certifying that adequate flood insurance has been or will be obtained in the following situations:

- (1) for NSF grants for the construction of a building or facility, regardless of the dollar amount of the grant; and
- (2) for other NSF Grants when more than \$25,000 has been budgeted in the proposal for repair, alteration or improvement (construction) of a building or facility.

Project Summary

The *Frequency Agile Solar Radiotelescope* (FASR) is a priority facility recommended by the decadal reviews of the *Astronomy and Astrophysics Survey Committee* (AASC) and the *Solar and Space Physics Survey Committee* (SSPSC), both sanctioned by the National Research Council. The SSPSC considered the Sun, the heliosphere, space weather, and the Earth as an integrated system, and gave FASR a top priority ranking for small projects (<\$250M) in recognition of the unique role it will play in addressing basic research questions, as well as its complementary role to other important instruments being developed and deployed to address the Sun-Earth system.

Intellectual Merit: FASR is a radioheliograph; that is, a radio telescope designed to observe the Sun. The central FASR innovation is to perform ultra-wideband radio imaging spectroscopy, imaging the Sun from the mid-chromosphere well up into the corona on a time scale of 1 s, and with an angular resolution as high as 1". In so doing, FASR enables a host of radio diagnostic tools and techniques that have been largely unavailable to date. These techniques will be used to address a number of key science objectives, including quantitative measurements of coronal magnetic fields, the physics of flares, drivers of space weather, and the physics of quiet Sun phenomena. While FASR exploits the extensive heritage provided by radio Fourier synthesis imaging techniques, as implemented through previous generations of radio telescopes, this innovative and wholly unique instrument opens a new observational regime.

Broader impact: FASR will play a transformative role in solar radiophysics, bringing a wide range of innovative and unique observations and techniques to bear on outstanding problems in solar, heliospheric, and space weather physics for the first time. It is anticipated to be one of the world's premier solar observatories for a generation. It will support the research of a broad scientific community. It will do so by pipelining data calibration and reduction, making FASR data, data products, and analysis tools available to as wide a user community as possible. As a university-run facility, FASR will provide extraordinary access to students, engineers, and postdoctoral scholars, and provide them the opportunity to participate in forefront science and technology. While FASR has been conceived as a basic research facility, it will likely provide a number of important data products to solar activity and space weather forecasting and "now-casting" programs. In this way, FASR's influence and role in society will extend beyond its basic research and education mission.

FASR will be constructed by a consortium formed under Associated Universities, Inc. (AUI). The FASR Consortium includes a number of university partners and a national facility (NRAO). As such, it includes the necessary scientific and technical knowledge and expertise to carry out the project successfully. The proposed duration of the project is five years at a cost of \$25M. The instrument is being designed with long-term operational costs clearly in mind. The anticipated annual cost of core operations is approximately \$2.5M.

THE FREQUENCY AGILE SOLAR RADIOTELESCOPE

A Preliminary Proposal to the NSF Division of Atmospheric Sciences for the Mid-Sized Infrastructure Opportunity

1 Introduction

Solar activity represents a uniquely accessible window on the ubiquitous processes of energy release and particle acceleration that occur on a wide range of contexts from the magnetosphere to the galaxy. Of more immediate significance, it is also the driver of many helio- and geophysical phenomena that have adverse impacts on modern space-based and ground-based technological systems. Solar activity is observable across the electromagnetic spectrum, and originates from a wide range of locations from the solar photosphere to the terrestrial atmosphere. Radio observations provide both a unifying perspective and a unique sensitivity to solar magnetic fields, the energy source for solar activity. As a result, radio emission provides a powerful source of diagnostic information with the potential for transformational insights into solar activity and its terrestrial impacts.

This is a proposal to construct the *Frequency Agile Solar Radiotelescope* (FASR), a solar-dedicated radio telescope that provides a unique combination of superior imaging capability and broad instantaneous frequency coverage to address a wide range of science goals. The potential value of such a facility has been recognized by high-priority recommendations for FASR from two separate major surveys of the future of science in the US conducted by the National Research Council. In particular the most recent decadal review of the *Astronomy and Astrophysics Survey Committee (2001)*, sponsored by the *Board on Physics and Astronomy* and the *Space Studies Board*, recommended FASR as one of a its priorities for "moderate-sized initiatives" across all of astrophysics. The *Solar and Space Physics Survey Committee (2003)*, sponsored by the *Space Studies Board*, made FASR its highest-priority "small project", in recognition of the unique and transformative role it will play in addressing basic research questions, as well as its complementary role to other important instruments being developed and deployed to address the Sun-Earth system.

FASR will be designed and constructed by a university-led consortium over a period of 5 yrs at a total cost of \$25M. The consortium consists of experienced groups with expertise in all of the areas required to design and accurately cost the instrument, to carry out construction on schedule and on budget, and to facilitate its exploitation by a wide user community. The FASR Consortium has been organized under Associated Universities, Inc. (AUI), a not-for-profit science management corporation that manages the National Radio Astronomy Observatory (NRAO).

The design of FASR proposed here has been adapted to reflect the *MSI Opportunity* cost cap. Although the necessary de-scope has implications for some of the secondary science goals of the original project, the instrument design nevertheless addresses the primary science goals of the FASR project and accommodates expansion and upgrades, should further resources become available. In this preliminary proposal, we summarize the key science objectives that the proposed instrument addresses (Section 2), describe the user community (Section 3), present a brief technical description of the instrument (Section 4), and discuss the project organization, top-level schedule, and operations (Sections 5-7).

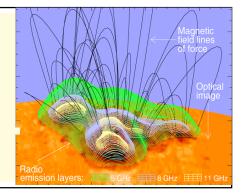

2 FASR Science

The major advance offered by FASR over previous generations of solar radio instrumentation is its unique combination of wide frequency coverage, high spectral resolution and high image quality. Observationally, it performs temporally-, spectrally- and spatially-resolved, broadband imaging spectroscopy over the full solar disk from centimeter to meter wavelengths. Radiation from this wavelength range probes the solar atmosphere from the middle chromosphere through to the middle corona and above in which a wealth of fundamental astrophysical processes occurs. FASR exploits this wavelength range to address a broad research program in contemporary solar physics, and in particular, phenomena with significant effects on the Earth and its atmosphere.

In this preliminary proposal we summarize the main science goals of the proposed instrument. The potential of FASR for breakthroughs in a wide range of science topics, resulting from extensive discussions among members of the solar and space physics community, is presented in detail in the book *Solar and Space Weather Radiophysics* (Gary & Keller 2004). In addition, a more complete description of the FASR science program is available online at http://www.fasr.org/FASR_Science.pdf. With its unique and innovative capabilities FASR also has tremendous potential for new discoveries beyond those presently anticipated.

2.1 The Nature and Evolution of Coronal Magnetic Fields

- What is the nature of the coronal magnetic field?
- *How does the magnetic field evolve in time and space?*
- How is magnetic energy stored?

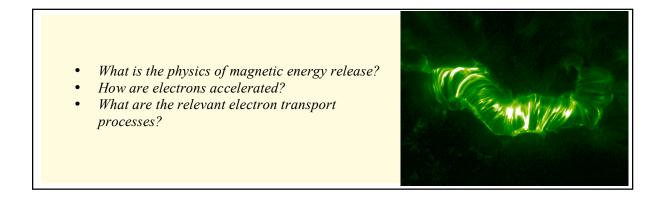

Quantitative knowledge of coronal magnetic fields is fundamental to understanding essentially all solar phenomena above the photosphere, including the structure and evolution of active regions, flares, coronal mass ejections, filaments, coronal heating, and acceleration of the solar wind. Yet useful quantitative measurements of the coronal magnetic field have been largely unavailable. Considerable resources are therefore devoted to observing the topology of the coronal field at EUV/SXR wavelengths and to measuring the vector magnetic field distribution at photospheric heights using spectral lines in the visible part of the spectrum and extrapolating the magnetic field into the upper chromosphere and corona under the assumption that it is potential or force-free. These extrapolations are difficult, depend sensitively on measurement errors, and rely on assumptions whose validity is unproven.

FASR will make measurements of active region coronal magnetic fields as accessible and as today's familiar photospheric magnetograms. The prime radio technique for doing so is the well-established gyroresonance method (e.g., White & Kundu 1997, White 2004). Such radio measurements, effective from 200-2000 gauss, allow coronal magnetic fields in active regions to be measured on the disk and above the solar limb. The gyroresonance method will be complemented by a variety of additional radio techniques, established over several decades, to measure coronal magnetic fields in a wide variety of physical environments: the use of free-free emission to measure the longitudinal magnetic field in the quiet Sun corona (e.g., Grebinskij et al. 2000, Gelfreikh 2004); the use of radio bursts (e.g., Dulk & McLean 1978) to measure fields in the middle corona; the use of gyrosynchrotron emission in flare loops and CMEs (e.g., Bastian et al. 1998, 2001); the use of mode coupling phenomena to place topological constraints on the coronal magnetic field (e.g., Ryabov 2004); and several other techniques (see Gary & Keller 2004). *In order to exploit any of these techniques effectively, radio imaging spectroscopy over a capability that is not available on existing radio telescopes or radioheliographs. The fundamental innovation of FASR is to perform imaging spectroscopy over a range of frequencies suited to exploit*

these techniques for measuring magnetic fields in active regions and the quiet Sun. FASR will be wholly unique in this transformative capability.

In the view of the community, coronal magnetography is a top priority science objective, and so the descoped design has emphasized configuring FASR to make high-quality, high-resolution images at frequencies above 2 GHz to meet this objective (see Section 4).

2.2 The Physics of Flares

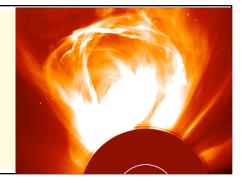

Outstanding problems in the physics of flares are those of magnetic energy release, particle acceleration, and particle transport, problems that extend to astrophysical problems well beyond the Sun. There has been significant theoretical progress in recent years on three-dimensional magnetic reconnection (see, e.g., Priest & Schrijver 1999 for a review) wherein reconnection can occur in a variety of magnetic topologies (spine reconnection, fan reconnection, separator reconnection and quasi-separatrix layer reconnection). Yet observational confirmation of 3D magnetic reconnection processes has remained elusive.

FASR will provide several unique avenues into the study of magnetic energy release, particle acceleration, and particle transport. Decimetric spike bursts and type-III-like bursts accompany impulsive energy release in flares (e.g., Aschwanden & Benz 1997). They are believed to be intimately related to the energy release process (Benz 1994; Bastian et al. 1998). Dynamic imaging spectroscopy is urgently needed to identify the location of these emissions. The transformative impact of FASR is that it effectively makes every time/frequency pixel in dynamic spectra available as a high-quality image. If the source is confirmed to be closely associated with the energy release site, new and unique diagnostics of the magnetic energy release process will become available. Gyrosynchrotron emission from nonthermal electrons accelerated in flares provides the means of testing electron acceleration (Miller et al. 1997) and transport models (e.g., Melrose & Brown 1976, Aschwanden et al. 1997, 1998). Furthermore, gyrosynchrotron emission illuminates any magnetic coronal loop to which nonthermal electrons have access. Such loops provide a valuable topological tool, linking any site of particle acceleration to more distant sites to which accelerated particles are transported. Furthermore, FASR will also be able to exploit dynamic spectroscopic imaging to measure simultaneously both the magnetic field in flaring loops and the evolving electron energy distribution as a function of location, including anisotropies in the distribution (Fleishman & Melnikov 2003a,b). Additional and independent constraints on magnetic field in the flaring source may be available through radio observations of Razin suppression (Ramaty 1969), of coronal loop oscillations (e.g., Trottet et al. 1981, Aschwanden et al. 2004a and references therein) and through timing comparisons between microwave and HXR fine structures (e.g., Bastian 1999). These

measurements will provide powerful new constraints on electron acceleration and transport mechanisms. FASR will therefore provide a *comprehensive and integrated* picture of the multitude of physical processes that occur during a flare.

2.3 The Drivers of Space Weather

- How are coronal mass ejections initiated and accelerated?
- What is the origin of coronal shocks?
- How are solar energetic particles accelerated?

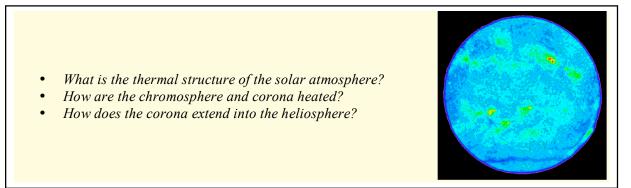

The term "space weather" refers to a vast array of phenomena that can disturb the interplanetary medium and/or affect the Earth and near-Earth environment (Lanzerotti 2004). The drivers of space weather are all solar in origin. An understanding of space weather phenomena lies, in part, in gaining a fundamental understanding of these drivers. FASR will be used to study a number of phenomena that drive space weather effects, including, but not restricted to, coronal mass ejections (CMEs), coronal holes (the origin of fast solar wind streams), and solar flares.

FASR will be able to study in quantitative detail the magnetic environments in which CMEs originate. FASR will image pre-CME environments on the disk and provide new constraints on their magnetic state. The most powerful CMEs produce a synchrotron signature that FASR may see at decimeter and centimeter wavelengths. (Bastian et al. 2001; Maia et al. 2007). Associated phenomena such as erupting filaments and prominences will also be imaged by FASR at higher frequencies.FASR will also make important contributions to the study of shocks in the corona, as manifested by type II radio bursts. The relationship between coronal shocks, their radio-spectroscopic signature, and other phenomena of interest such as the radio counterparts to "EIT waves" (see White & Thompson 2005), EUV coronal dimmings (Harrison et al. 2003), and the white light CME remains a matter of considerable interest and controversy (e.g. Gopalswamy 2000). With its unique ability to perform imaging spectroscopy, FASR will be able to simultaneously image the basic shock driver (flare or CME signature), the response of the atmosphere to the driver (chromospheric/coronal waves and coronal dimmings), and shocks that may form due to the flare or the CME via type II emission. The emphasis placed on FASR's ability to provide an integrated picture of the flare phenomena applies equally to space weather drivers.

The proposed instrument will image the CME precursor environment, eruption phenomena, certain higher frequency CMEs, and detect and track radio bursts of type II, type III, and type IV, providing detailed information about their timing, location, and relation to associated phenomena such as energetic particle events. FASR will therefore provide a comprehensive and quantitative observational picture of space weather phenomena and their drivers. We note that when paired with the space-based radio instrumentation on board STEREO, *FASR and STEREO will provide radio coverage of space weather phenomena from their point of origin to 1 AU*. FASR is therefore expected to play an important role in space weather science, forecasting, and "now-casting". Similarly, when the *Solar Orbiter* and *Solar Sentinal* missions are deployed, FASR will be well-positioned to provide unique and complementary

space weather data. Operational emphasis will be given to supplying real-time data products that will assist with such activities.

2.4 The Physics of the Quiet Sun

In addition to observing the active Sun, free-free radio emission from the quiet Sun can be exploited by FASR to provide distinctive insights into several quiet sun problems. For example, resonance wave heating (e.g., Ofman, Klimchuk, & Davila 1998; Cranmer, van Ballegoojan, & Edgar 2007) represents one (of many) models for coronal heating and makes specific predictions of the location and time scales of energy deposition in coronal loops. Using free-free diagnostics, FASR observations of the resulting temperature changes can address the validity of such predictions. A second area is the role of "nanoflares" (Parker 1988). The energetics of such small events depends critically on their thermal properties and the role, if present, of accelerated electrons (e.g., Christe et al. 2007, Hannah et al 2007). Again, the combination of FASR's frequency coverage and imaging can supply diagnostics to quantitatively address such issues. A third example is the strength, distribution and evolution of magnetic fields in prominences and filaments, as deduced from the polarization of free-free emission (e.g., Grebinskij et al. 2000, Gelfreikh 2004). FASR can use imaging spectroscopy to directly measure the longitudinal magnetic field in filaments and prominences. *The exploitation of free-free emission to determine the temperature, density and magnetic fields in the quiet chromosphere, corona, and prominences is possible only as a result of FASR's unique attributes.*

3 The FASR Community

The FASR user research community will include, but certainly not be restricted to, scientists working in solar and heliospheric physics, space weather science, and ionospheric/exospheric science. Many of these users will not be familiar with radio interferometric techniques and to address this FASR will provide a wide range of fully-processed, calibrated data products, including light curves, dynamic spectra, and images, as well as coronal magnetograms, and coronal density and temperature maps derived from them. For users interested in collaborative studies, FASR will provide maps, light curves, and parametric maps (magnetic field, density, temperature) to match the user requirements, but that again do not require familiarity with interferometric techniques. In other words, FASR will mainstream the use of radio data, in the same way the use of soft x-ray and EUV images have become an integral part of solar studies as a result of Yohkoh, TRACE and SOHO/EIT data. With the launch of STEREO and *Hinode*, and the impending launch of SDO, new and extensive opportunities will become available for collaborative science, with FASR providing unique and complementary data to the rich data sets of these missions.

Since many of these data products could be made available in close to real time, FASR data may in addition, play an operational role in forecasting and now-casting solar activity and space weather effects

that directly affect the Earth's atmosphere. It will therefore likely support additional constituents who do not necessarily have a research interest in the data but nevertheless have a keen interest in certain FASR data products and their timely delivery. Optimization of data processing for these applications may require additional sources of funding, but these are expected to be external to NSF.

Given its unique capabilities, its transformative potential, planned ease of use, and currently demonstrated interest, we anticipate that FASR will attract a large, diverse and international user base.

4 Technical Overview

FASR's design is driven by a number of factors. First, the instrument must meet the science specifications derived from the key science objectives outlined Section 2. Second, as discussed above, it is expected that a large and diverse scientific community will exploit FASR data. Since most users will not be radio interferometrists, they should not bear the burden of data calibration and reduction. As a result, these functions must be performed by pipeline data processing that delivers high-level, fully calibrated data products to a broad user community. Third, it is imperative to implement the project within the *MSI Opportunity* funding constraints and to control the long-term operating and maintenance costs. Finally, it is important to design an expandable/upgradable system in order to respond flexibly to opportunities presented by new resources, new technologies, and/or new science objectives. *These broad drivers have resulted in a design that emphasizes simplicity, utility, reliability, maintainability, and expandability.*

A more detailed technical description of FASR, as represented by the FASR Reference Instrument (FRI) is available at <u>http://www.fasr.org/FASR-OM-Plan.pdf</u>. Although this document is based on a larger FASR implementation, the proposed FASR shares the same primary scientific objectives and incorporates the same design elements.

4.1 Instrument Specifications

The science objectives outlined in Section 2 flow down to the high-level science and technical specifications summarized in Table 1. These specifications reflect an optimized set of requirements designed to maximize scientific return within the MSI Opportunity cost cap. FASR is designed to perform Fourier synthesis imaging using well-established interferometric techniques. Observations in a given frequency range use an array of Nantennas. Each antenna pairing, of which there are $\sim N^2/2$, measures a single Fourier component of the Sun's radio brightness distribution at a given frequency, time, and spatial frequency. The ensemble of antenna pairs, or antenna baselines, therefore measures many Fourier components.

2.9 km EW x 3.8 km NS 1 arcsec

FASR observations will cover the required frequency range – 50 MHz to 21 GHz – using three separate sub-arrays of antennas, denoted as FASR-A, -B and -C Each sub-array provides frequency coverage over roughly a decade of bandwidth: 2-21 GHz (FASR-A); 0.3-2.8 GHZ (FASR-B), and 50-350 MHz

over roughly a decade of bandwidth: 2-21 GHz (FASR-A); 0.3-2.8 GHZ (FASR-B), and 50-350 MHz (FASR-C). The antennas will be distributed over an area of approximately 3×4 km, providing a frequency-dependent angular resolution of 1" at 20 GHz. At all frequencies, the angular resolution is sufficient to spatially resolve all solar radio sources observed to date. The antenna size for each sub-array is determined by the competing needs of full disk imaging on the one hand, and sufficient sensitivity to calibrate the instrument against sidereal and/or artificial (satellite) sources on the other. Similarly, the number and configuration of antennas in each array is driven by the need to address key science goals in each of the frequency domains.

4.2 FASR Antennas and Feeds

As mentioned above, FASR uses three types of antennas to cover 50 MHz to 21 GHz, each type covering roughly a decade of bandwidth. For each band, FASR uses ultra-wideband dual-linearly polarized feeds to ensure good performance over the relevant frequency range without needing to refocus the optics. The only mechanical systems on the antennas are the drives needed to point the steerable paraboloids used for FASR-A and -B. FASR-C has no mechanical systems since it employs fixed stations of log-periodic dipoles (or similar) that are electronically phased and steered. There are 45 FASR-A antennas, 15 FASR-B antennas, and 15 FASR-C stations. The smaller number of antennas in FASR-B and -C will nevertheless be sufficient to study the bright, relatively compact sources produced by solar activity as discussed in Sections 2.2 and 2.3. Site infrastructure is being planned to allow straightforward expansion of the FASR-B and -C arrays, should additional funding from other sources become available.

4.3 Analog Signal Processing

For each sub-array, analog electronics at the antennas perform essentially the same functions: amplify the observed radio frequency signal (RF), inject calibration signals as needed, perform the first stage of phase switching as needed, and transmit the two analog linearly polarized RF signals via ultra-broadband fiber optic link to a central processing hub. The antenna electronics will be maintained in an environmentally secure and stable environment. They need not be cryogenically cooled, however, thereby simplifying the electronics and enhancing reliability. The transmission of analog rather than digital signals from the the antennas eliminates the need for fast digital samplers at the antennas themselves and so enhances the simplicity and reliability of field systems while also reducing the risk of producing unwanted radio frequency interference (RFI).Automatic attenuators are employed both at the antennas and in subsequent processing to ensure that the wide range of frequency- and time-dependent solar signal levels are within the dynamic range of processing electronics. Data analysis software uses the state of these attenuators to infer the original signal levels.

The bulk of FASR signal processing is located in the central processing hub, a fully shielded and environmentally controlled building. To make the most of available resources, both frequency and baseline mulitplexing are employed by which different frequencies and baseline combinations are processed in successive 20 ms time integrations. This compromise (not practical for sensitivity-limited systems) is well suited to strong solar radio signals. For a given correlator size, it enables the number of antennas to exceed the number of available correlator inputs, thereby maximizing image quality. In this case, 30 of the 45 FASR-A antennas are correlated at any instant (see Section 4.5).

For a given 20 ms correlator cycle, optical switches select a group of 30 antennas; their signals are demodulated from the optical carrier; a specific 500 MHz segment of RF bandwidth is selected and the RF signals converted to an intermediate frequency (IF) band (650-1150 MHz).

4.4 Digital Signal Processing

The IF signal is input to the Digital Signal Processing Unit (DSPU), which processes 30 antennas simultaneously. Automatic attenuators at the RF/IF conversion stage ensure that the signals going into the DSPU remain within sampler tolerances. Each analog signal is digitized with an 8-bit, 1.2 GS/s sampler. After digitization, the signals are passed through a digital filter bank that sub-filters the 500 MHz of bandwidth into 4000 sub-bands, each with a bandwidth of 128 kHz. Signal statistics for each antenna and for each sub-band are generated for subsequent use in automated RFI detection. Each sub-band is corrected for "coarse" and "fine" delay and fringe rotation, and a second stage of phase switching is applied as needed. Each pair of linearly polarized data channels from a given antenna is converted to a pair of circularly polarized data channels by means of a "digital hybrid".

For a given polarization the signal from each antenna pair is multiplied and accumulated in the correlator, whose raw output is one *complex visibility* (Fourier component) for each antenna baseline, circular polarization, and frequency sub-band. These data are transferred to a processor that excises frequency sub-bands that are corrupted by RFI, averages uncorrupted sub-bands in frequency to science resolution (nominally 1% or 5 MHz whichever is smaller), and computes the appropriate statistical weights assigned to the science visibility data. The data are then written to an interim archive where further data processing occurs offline. Finally, we note that a comprehensive monitor and control system will overlay the FASR system, providing system control and the means to monitor the health of the instrument, allowing the identification of faults or failures quickly during operations.

4.5 Frequency and Baseline Multiplexing

As noted in Section 4.3, FASR leverages enhanced performance via frequency and baseline multiplexing. The very broad frequency range covered by the FASR-A, -B, and -C antennas is sampled as a sequence of 500-MHz RF segments, each of 20 ms duration. The sampling sequence is fully programmable – hence, the *frequency agility* of FASR. Enhanced sampling of the aperture by FASR-A will be achieved by means of baseline multiplexing. FASR-A comprises 45 antennas, yet only 30 at a time can be processed by the DSPU. Although three successive cycles with different subsets of 30 antennas are needed to process all possible antenna pairs in FASR-A, baseline multiplexing more than doubles the number of visibility measurements over a 30-antenna array. Note that all 2 x 15 antennas of FASR-B and -C arrays can be processed together and simultaneously in this processing architecture. For a typical (programmable) baseline multiplex sequence, therefore, the resulting overall time resolution in FASR-A is 1 second for snapshot maps, 3 seconds for slowly varying sources requiring coverage by all antenna baselines, 1 second for FASR-B and 0.2 seconds for FASR-C (Table 1).

4.6 Data Pipeline and Archive

FASR "mainstreams" the use of its multi-frequency radio data and derived data products, much as the *Yohkoh* and RHESSI missions mainstreamed the use of X-ray data, and the SOHO and TRACE missions mainstreamed the use of EUV data. To do so, FASR delivers data and data products that are easily accessible to the community without placing the burden of data calibration and reduction on the user. This is done through pipeline data calibration and reduction, and the production of an archive of applications databases. The scale of the archived database is about 50 GBytes per day. In addition an extensive suite

of high level data products is made available online, for immediate use by the community. Of course, expert users always have access to the raw visibility data.

4.7 Technological Heritage and Readiness

FASR exploits a radio astronomical technique that has a long and fruitful history, namely, Fourier synthesis imaging using interferometry. The FASR design therefore builds on a solid technical heritage as well as a substantial heritage of calibration, mapping, and deconvolution techniques that provide confidence in the approach. Yet FASR is also pioneering the application of new and emerging technologies and techniques. Unlike previous generations of radio telescopes and radioheliographs, FASR requires the development and use of ultra-wideband feeds and receivers. By observing over a very large frequency bandwidth, FASR is exposed to RFI signals that must be identified and removed from the data. Finally, FASR uses a number of novel digital signal processing techniques to simplify the hardware design.

The development of these innovative hardware designs and signal processing techniques has been supported by three funding sources: the development of ultra-broadband devices has been supported through an ATM MRI grant to the NRAO and by ATM support of the FASR Design and Development Plan. The development of approaches to digital signal processing, including RFI mitigation techniques, and optimum correlation approaches, has been supported by an AST ATI grant to NJIT. The project is therefore well positioned to proceed with FASR construction.

4.8 Risk Mitigation

Although FASR draws upon substantial technological heritage and experienced personnel at the NRAO and the universities, as with any project there are potential technical and programmatic risks. The construction project will employ modern project management tools to identify risk elements in terms of their probability of occurring and their potential impact on project cost and schedule. Potential technical risks include innovations noted above; namely, the broadband feeds, receivers, certain signal processing techniques, and instrument stability requirements. These risk elements will be mitigated by rigorous testing in the laboratory prior to deployment, and field-testing with engineering prototypes (Section 5) prior to a full instrument build-out. In addition, a *Reliability Engineering* agreement has been initiated with the *Center for Advanced Life Cycle Engineering* (CALCE) at the University of Maryland to help establish the design, fabrication and operations framework necessary to meet performance and reliability goals.

5 FASR Project Organization

The FASR construction project will be carried out by the FASR Consortium. The FASR Consortium is a partnership between the NRAO and a number of U.S. universities with strong interest and experience in the science and/or technology elements of the project: the New Jersey Institute of Technology, The University of Michigan, the University of California at Berkeley, the University of Maryland, and the California Institute of Technology. These efforts will be organized under Associated Universities, Inc. (AUI), a not-for-profit science management corporation. AUI will be the interface to the NSF, form and operate the project office, and provide governance and oversight of the project through bylaws drawn up by AUI and the FASR Consortium. The FASR partners will assume a number of critical roles and responsibilities ranging from hosting the instrument site, to hardware design and production, software development, and operations planning. It is expected that university students and postdocs will be closely involved with the construction project and during subsequent operations. The specific roles and responsibilities of each partner are outlined in the budget and explanatory supplement. As such, the

Consortium draws upon a broad talent base with roots in both the radio astronomical and solar/heliospheric science communities.

6 Schedule

The FASR construction project will be of five years duration. In the first two years, the detailed design of major subsystems will be completed, prototypes will be fabricated and tested, and an engineering prototype array will be deployed and tested at the proposed instrument site, the Owens Valley Radio Observatory (OVRO) in California. Hardware design and prototyping work will occur at the NRAO (analog systems) and UM (digital systems), where the relevant systems will be rigorously tested and validated in the lab and under field conditions. The FASR Engineering Prototype (EP) will then be deployed at OVRO during the second year of the project and at the beginning of year three. The FASR EP will enable the analog, digital, and software systems to be integrated and thoroughly tested. The EP will exploit existing site infrastructure and will itself require little site development. These steps will ensure that all FASR systems perform to specification and are well understood before committing to hardware production runs and the array build-out. Site development activities will commence in year one in anticipation of the EP, and in year two in preparation for the full array build-out. In years three and four of the project, hardware subsystems will go into production and the array will be assembled. This will include the deployment of antennas in the field, the analog and digital electronics in the hub, and deployment of the computing infrastructure. Year five will largely be devoted to commissioning FASR for operations. In parallel to these efforts, the FASR software and data management systems design and implementation will be initiated in year one and extend through year five. A high level schedule is shown presented with the budget justification.

7 FASR Operations

The core mission of the FASR Observatory is to operate the instrument in an optimum fashion, to make high quality data and data products available to the community in a timely fashion, and to provide the user community with the guidance and tools needed to do excellent science.

When FASR transitions to operations, it will be organized as a standalone observatory organized under AUI. FASR will be managed by AUI as an observatory independent of NRAO. The FASR Observatory will comprise two sites: the instrument site at OVRO and a science center. OVRO is located between Big Pine and Bishop, CA, approximately 400 km north of Los Angeles. A great deal of the necessary site infrastructure is already in place. The science center will be hosted by one of the university partners, to be selected during the construction phase. The science center will serve as administrative headquarters of the facility in addition to providing operations oversight and science support to the community. As part of FASR design and development planning, a detailed operations and maintenance plan was prepared (available at http://www.fasr.org/FASR_OM_Plan.pdf). The plan developed the FASR Reference Instrument (FRI) for use as a cost basis in planning. The FRI differs from the instrument described herein primarily in the number of antennas deployed. For the FRI the long-term annual FASR O&M costs are shown to be approximately \$2.5M

Budget Justification

The FASR Consortium

The budget reflects the organizational model adopted by the FASR Project. As a consortium that includes both universities and a national facility, the Project is under management by Associated Universities, Inc (AUI) and AUI is therefore the submitting organization on behalf of the Project, with AUI President Dr. E. Schreier serving as the principal investigator. The partner institutions and the group leaders in each case are, respectively, New Jersey Institute of Technology (Dr. D. Gary), the University of California at Berkeley (Dr. G. Hurford), the University of Michigan (Dr. C. Ruf and Dr. T. Zurbuchen), the University of Maryland (Dr. S. White), the California Institute of Technology (Dr. A. Readhead), and the National Radio Astronomy Observatory (Dr. T. Bastian).

Partner Roles and Responsibilities

AUI will be responsible for disbursement of funds received for the purpose of FASR construction. It will do so by means of sub-awards to the partner institutions. AUI will also be responsible for the formation and funding of the FASR Project Office, and for governance and oversight of the project. The project office includes the project director, project manager, and project engineer. The office will be provided business services support (contracts, procurement, invoicing) and project management support (budget control, scheduling, and analysis), and secretarial support. The Project Office will be responsible for planning and implementing the FASR construction project.

The NRAO will be responsible for the design, fabrication, and testing of all analog subsystems. See Section 4.3 of the project description.

The University of Michigan will be responsible for the design, fabrication, and testing of the Digital Signal Processing Unit. See Section 4.4 of the project description.

The University of California at Berkeley will be responsible for FASR software and data management systems, with participation by the University of Maryland. See Section 4.6 of the Project description.

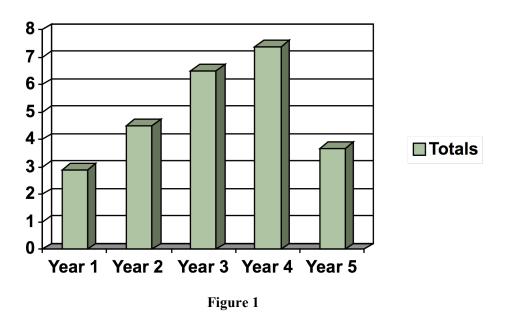

The California Institute of Technology will be responsible for site acquisition and development activities.

The New Jersey Institute of Technology will be responsible for system validation and testing, and commissioning activities.

Each of these broad roles is subject to revision.

Budget Overview

The project is of five years duration. A provisional funding profile is summarized in Fig. 1 below. 2007 dollars are assumed throughout. The numerical values are in units of \$1M. The project total is \$25M.

The fractional budgets according to major project activities and systems are summarized schematically in Fig. 2.

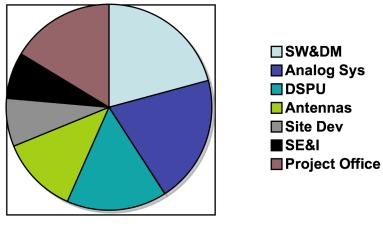

Figure 2

Project Schedule

A schematic schedule showing the phasing of planned activities is appended to this budget justification. Activities (IPTs) are listed in alphabetical order. An overview of these activities is provided in Section 5 of the project description.

Budget Detail

Year 1: The budget for the first year is \$2.9M. The AUI portion is \$0.7 M and includes funding for the project office (personnel, travel, and business services), acquisition of prototype antennas (commercial vendor), and the corporate office indirect costs/management fee. A value of \$150k is used for "Business Support Costs" on line G.6. The sub-awards total \$2.2M and are expected to be distributed as follows:

\$0.6M for software and data management system definition
\$1M for detailed design and prototyping of analog subsystems
\$0.4M for detailed design of the DSPU
\$0.1M for development of validation and testing procedures
\$0.1M for site acquisition activities, EP site development

Year 2: The budget is \$4.5M. The AUI portion is \$1.15M and again includes funds for the project office, prototype antennas, and the corporate office indirect costs/management fee. Salaries are increased by 3.5%. The sub-awards total \$3.35M and are expected to be distributed as follows:

\$1.1M for prototype versions of M&C, DPP, and database management
\$1.15M for prototype testing and deployment of the EP
\$0.7M for COTS system for EP; detailed design of DSPU
\$0.2M for SE&I of EP
\$0.2M for site infrastructure prep

Year 3: The budget is \$6.50M. The AUI portion is \$2.0M and includes funding for the project office, production antennas, and the corporate office indirect costs/management fee. The sub-awards total \$4.5M and are expected to be as follows:

\$1.1M for testing and development of SW&DM with the EP
\$1.25M for production module design, fabrication, and FASR B build-out
\$1.35M for completion of DSPU design and module-level fabrication
\$0.45M for FASR B SE&I
\$0.35M for site prep for FASR build-out

Year 4: The budget is \$7.41M. The AUI portion is \$2.41M and includes funding for the project office, production antennas, and the corporate office indirect costs/management fee. The sub-awards total \$5M and are expected to be as follows:

\$1.2M for software build-out of M&C, DPP, calibration, data analysis; preliminary version of pipeline, preliminary version of user interfaces

\$1.3M for production module design, fabrication, and FASR A build-out

\$1.1M for DSPU integration and testing

\$0.7M for FASR and B SE&I

\$0.7M for site infrastructure and build-out

Year 5: The budget is \$3.69M. The AUI portion is \$0.84M and includes funding for the project office and the corporate office indirect costs/management fee. The sub-awards total \$2.85M and are expected to be distributed as follows:

\$1.2M for software systems testing and commissioning, refining user interfaces

\$0.35M for production and deployment of FASR C systems

\$0.45M for completion of DSPU installation and testing

\$0.45M for SE&I and commissioning activities

\$0.4M for completion of site infrastructure upgrades

FACILITIES, EQUIPMENT & OTHER RESOURCES

FACILITIES: Identify the facilities to be used at each performance site listed and, as appropriate, indicate their capacities, pertinent capabilities, relative proximity, and extent of availability to the project. Use "Other" to describe the facilities at any other performance sites listed and at sites for field studies. USE additional pages as necessary.

Laboratory:	See appended proposal.
Clinical:	n/a
Animal:	n/a
Computer:	See appended proposal.
Office:	See appended proposal.
Other:	See appended proposal.

MAJOR EQUIPMENT: List the most important items available for this project and, as appropriate identifying the location and pertinent capabilities of each.

See appended proposal.

OTHER RESOURCES: Provide any information describing the other resources available for the project. Identify support services such as consultant, secretarial, machine shop, and electronics shop, and the extent to which they will be available for the project. Include an explanation of any consortium/contractual arrangements with other organizations.

January 10, 2008

Dear Colleagues:

Associated Universities, Inc. (AUI) is pleased to submit this preliminary proposal to the MSI Opportunity program for the construction of the *Frequency Agile Solar Radiotelescope* (FASR). AUI is submitting this proposal on behalf of the FASR Consortium, a partnership including a number of U.S. universities and a national facility, formed for the explicit purpose of constructing and operating FASR. The Consortium has been organized under AUI, a not-for-profit science management corporation. AUI will serve as the interface between the Consortium and NSF, form the FASR project office, and provide governance and oversight of the project through bylaws drawn up by AUI and the Consortium. The Letter of Intent to establish the Consortium, signed by all the partners, is attached.

The Consortium includes the National Radio Astronomy Observatory, the University of California at Berkeley, the California Institute of Technology, the New Jersey Institute of Technology, the University of Michigan, and the University of Maryland. This partnership represents a strong base with broad experience in both the science that is addressed by FASR and the technological expertise needed to successfully implement the project. AUI and the NRAO offer extensive project management experience and administrative support, with a demonstrated record of success in managing forefront radio astronomical projects including the VLA, VLBA, GBT, with EVLA under construction. AUI is also the North American Executive for ALMA, with NA project management at NRAO. The university partners will assume a number of critical roles and responsibilities ranging from hosting the instrument site, to hardware design, software development, and operations planning. It is expected that university students and postdocs will be closely involved with the construction project and during subsequent operations. FASR, when complete, will be operated by AUI, with the participation of the Consortium members, as a separate observatory.

This preliminary proposal to the MSI Opportunity calls for constructing FASR over a period of 5 years, at a total cost of \$25M. It is anticipated that after commissioning and the transition to stable operations, the annual cost of FASR operations and maintenance will be approximately \$2.5M. AUI and the FASR Consortium look forward to the opportunity to submit a full proposal for the construction of this priority facility.

Sincerely,

Ethan John

Dr. Ethan J. Schreier President Associated Universities, Inc.

Statement of Intent To Propose for the Frequency Agile Solar Radiotelescope

PURPOSE:

The purpose of this document is to express the intent of Associated Universities, Incorporated (AUI)¹, the undersigned university groups, and AUI's National Radio Astronomy Observatory (NRAO) to form a team to propose for the construction and operation of the Frequency Agile Solar Radiotelescope. The parties to this agreement believe it to be in the best interests of the research community for AUI to establish a new entity under its management to build and operate this new facility.

The Frequency Agile Solar Radiotelescope (FASR) is designed to provide ultra-wideband imaging spectroscopy of the solar atmosphere from the chromosphere to the outer corona, with temporal, angular, and spectral resolution matched to the physical processes that occur. FASR was recommended as a the number one small program (<\$250M) by the 2002 Decadal Survey *The Sun to the Earth – and Beyond*, and also as a priority project in the 2000 Decadal Survey *Astronomy and Astrophysics in the New Millennium*. Both the NSF Atmospheric Sciences and NSF Astronomical Sciences Divisions have been supporting the technology and operations concept development for FASR. NRAO, AUI, and several university groups have been supporting and contributing to this effort.

FASR will be a facility that uses modern technology to provide a large multi-purpose database for use by the entire solar and heliospheric science community. A number of university groups have expressed substantial interest in the technology required by FASR as well as in the research to be enabled by FASR. NRAO, a facility of the NSF that is managed by AUI is a source of enabling technology and project management expertise for FASR.

CONCEPT

Via this agreement, AUI is establishing a consortium of academic institutions that have interest, expertise, relevant experience, and a desire to participate in the science research and/or technology development areas of FASR. These institutions include: New Jersey Institute of Technology, University of Michigan, the Space Science Laboratory of the University of California at Berkeley, the University of Maryland, the California Institute of Technology, and the National Radio Astronomy Observatory. These institutions will

¹ AUI is a not-for-profit research management corporation established to unite the resources of universities, research organizations and the Federal Government in the planning, construction, and operation of forefront scientific facilities that promote discovery and education while expanding our knowledge of the physical world.

participate in the construction of FASR as well as in the operations. Other institutions may be added as appropriate and as mutually agreeable.

The parties agree that AUI will be the legal entity responsible to NSF to build and operate FASR. AUI will involve the parties to this agreement in the construction and operation of FASR, and in the governance structure of FASR. We anticipate that NSF will issue a Cooperative Agreement for the construction and operation of FASR, in which case the AUI President will be the PI. AUI will establish a FASR Oversight Council (FOC), whose membership will comprise AUI Trustees and representatives named by the participating consortium members. Additionally, the President of AUI will be a voting member of the Council ex-officio.

A Project Director for the construction and commissioning phases will be named in the Proposal, likely a staff member at one of the participating institutions. The Project Director will be supported by funds from the Cooperative Agreement, and will be responsible to the FOC for the overall project.

The construction activities will be managed by AUI via NRAO. NRAO will, with the concurrence of the FOC and the Project Director, name a Project Manager who will be responsible for constructing FASR within programmatic constraints. The Project Manager will distribute work among the team partners in the most cost effective way and in accordance with the available skills of each partner. The Project Manager will report to the Project Director, with overall management oversight by the FOC.

Operations will be managed by AUI via a management structure separate from NRAO, with the FASR Director reporting directly to the AUI President, and with Management Oversight by the FOC. Operations will take place at two sites: an Operations Center at the proposed instrument site (the Owens Valley Radio Observatory, operated by the California Institute of Technology) and a Science Center, likely hosted by one of the participating universities (TBD). Staff at the two centers will be either AUI/FASR employees, or university staff working under contract to AUI. An open search for a FASR Director will be initiated by the FOC prior to the start of operations. He/she will be selected by the FOC and report administratively to the AUI President. An independent FASR Visiting Committee will be established by AUI.

Synergistic Activities

- 1998-present: As Imager Scientist, led the efforts in optical design, calibration and data analysis software for RHESSI, a NASA mission for imaging/spectroscopy of solar x-rays and gamma-rays.
- 1997-1998: Member, NAS-NRC Task Group on Ground-Based Solar Research
- 1995-present: Charter participant in the development of the Frequency-Agile Solar

First Class Honours in Physics (Theoretical) Physics (Nuclear) Physics (Space) Physics Radiotelescope

- 1993-1998: Conceived and co-developed the Solar Radio Burst Locator, an automated system for monitoring solar activity at microwave wavelengths
- 1980-1998: Conceived and co-developed the Owens Valley Frequency-Agile Interferometer and its evolution into the Owens Valley Solar Array, for microwave imaging/spectroscopy of solar flares and active regions

DR. GORDON HURFORD: CURRENT AND PENDING SUPPORT

A. Current Support

Project Title: Sponsor and POC:	<i>High Energy Solar Spectroscopic Imager (HESSI) Investigation</i> NASA (Small Explorer); NAS5-98033 P.I. Robert Lin
Period and Amount:	11/19/97-02/28/08; \$55,515,870
FTE Work-Years:	up to 0.50/year
Project Title:	Advanced Topics in Solar Gamma-Ray Imaging and Spectroscopy
Sponsor and POC:	University of California, Santa Cruz (NASA); Dr. David M Smith
Period and Amount:	03/01/05-04/30/08; \$135,539
FTE Work-Years:	0.20/year
Project Title:	Broadband RF Transmission Characterization and Phase Stabilization for FASR
Sponsor and POC: Period and Amount: FTE Work-Years:	New Jersey Institute of Technology (NSF); Dr. Dale E. Gary 09/01/04-08/31/08; \$182,500 0.25/year
Project Title:	Statistical Survey of Hard X-ray Footpoints in Solar Flares
Sponsor and POC:	NASA; T. Kucera
Period and Amount:	12/01/06-11/30/08; \$201408
FTE Work-years:	0.083/year
Project Title:	Technology Development for the Spectrometer/Telescope for Imaging X-rays (STIX) Instrument on Solar Orbiter
Sponsor and POC:	University of California (Calspace); R. Anderson
Period and Amount:	12/01/06-11/30/08; \$47772
FTE Work-years:	None

B. Pending Support

Project Title:	Frequency Agile Solar Radiotelescope (this proposal)
Sponsor and POC:	National Science Foundation
Period and Amount:	10/01/08-09/30/013; \$25,000,000
	P.I.: E. Schreier, AUI
FTE Work-years:	0.5/year

Biography

CHRISTOPHER S. RUF

Professor of Atmospheric, Oceanic & Space Sciences and Electrical Engineering & Computer Science Director, Space Physics Research Laboratory The University of Michigan 1533 Space Research Building Ann Arbor, MI 48109-2143 (734) 764-6561 (Voice) (734) 936-0503 (Fax) cruf@umich.edu (Email) http://www.sprl.umich.edu http://ktb.engin.umich.edu

Education

Ph.D.	1987	Electrical and Computer Engineering, Univ. of Massachusetts at Amherst
B.A.	1982	Physics, Reed College, Portland, OR

Professional Experience

May 2006 - present	Director, Space Physics Research Laboratory
	University of Michigan, Ann Arbor, MI
Sep 2004 - present	Professor, Departments of AOSS and EECS
	University of Michigan, Ann Arbor, MI
Jul 2000 – Aug 2004	Associate Professor, Departments of AOSS and EECS
	University of Michigan, Ann Arbor, MI
Sep 2000 – Dec 2000	Guest Professor, Department of Electromagnetic Systems
-	Technical University of Denmark, Lyngby, DK
Jul 1997 - Jun 2000	Associate Professor, Department of Electrical Engineering
	Pennsylvania State University, University Park, PA
Jan 1992 - Jun 1997	Assistant Professor, Department of Electrical Engineering
	Pennsylvania State University, University Park, PA
Jul 1988 - Dec 1991	Member of Technical Staff, Microwave Observational Systems
	Jet Propulsion Laboratory, Pasadena, CA
Jun 1987 - Jun 1988	Visiting Professor and Research Engineer
	Department of Electrical and Computer Engineering
	University of Massachusetts, Amherst, MA

Former and Present Ph.D. Students

Justin Bobak, M.S. 1994, Ph.D. 1998 Sandra Cruz-Pol, Ph.D. 1998 Shannon Brown, Ph.D. 2005 Hirofumi Kawakubo, Ph.D. *in progress* Boon Lim, Ph.D. *in progress* Jinzheng Peng, Ph.D. *in progress* John Puckett, Ph.D. *in progress*

Former and Present postdocs

Haley Gu, 2006 - 2007

Professional Affiliations and Service

Member, National Academies NRC Committee on Spectrum Allocation, 2006-present
Member, National Academies NRC Committee on Earth Science and Applications from Space, 2005-2006
Member, National Academies NRC Committee on Radio Frequency, 2000-2003
Fellow, Institute of Electrical and Electronics Engineers (IEEE)
Member, American Geophysical Union (AGU)
Member, American Meteorological Society (AMS)
Member, International Union of Radio Science (URSI), Commission F
Associate Editor, AMS Journal of Atmospheric and Oceanic Technology (2006-present)
Associate Editor, IEEE Transactions on Geoscience and Remote Sensing (2001-present)
Guest Editor, IEEE Trans. Geosci. Remote Sens. (2005-2006)
Editor, *IEEE Geoscience and Remote Sensing Society Newsletter* (1997-2000)
Guest Editor for *Radio Science*, American Geophysical Union (1997-1998)
Associate Editor, *Radio Science*, American Geophysical Union (1992-1997)

Honors and Awards

1997:	IEEE Transactions on Geoscience and Remote Sensing Prize Paper Award
1999:	IEEE Judith A. Resnik Technical Field Award
2001:	Fellow, IEEE "For contributions in the development, calibration and remote
	sensing applications of microwave radiometers"
2006:	IEEE Geoscience and Remote Sensing Society Symposium Prize Paper Award

Curriculum Vitae Stephen M. White

Business Address: Department of Astronomy University of Maryland College Park MD 20742 Telephone: 301 405 1547 E-mail: white@astro.umd.edu Home Address: 8529 58th Avenue Berwyn Heights, MD 20740

November, 2007

Education

Ph.D. in Theoretical Physics, University of Sydney, 1979-84

B. Sc. with honours, first class (majoring in Theoretical Physics, Physics and Pure Mathematics), Australian National University, 1975–78

Essendon High School (dux, 1974), Melbourne, Australia

Appointments

Associate Research Scientist, Department of Astronomy, University of Maryland, 1991-present

Faculty Research Associate, Department of Astronomy, University of Maryland, 1987–1991

Alexander-von-Humboldt Scholar, Max Planck Institut fur Astrophysik, Garching-bei-Munchen, West Germany, 1986–87

Faculty Research Associate, Astronomy Program, University of Maryland, 1985-86

Tutor in the School of Physics, University of Sydney, 1980-83

Publications

Publications most relevant to this proposal:

- 129. "Radio Measurements of the Height of Strong Coronal Magnetic Fields Above Sunspots at the Solar Limb", J. W. Brosius & S. M. White, Astrophys. J. Lett., 641, L69, 2006.

Synergistic Activities

Maintain the archive for the Green Bank Solar Radio Burst Spectrometer at http://gbsrbs.nrao.edu/, mirrored at http://www.astro.umd.edu/~white/gb

Maintain a web site on solar and stellar astrophysics at http://www.astro.umd.edu/~white/.

Collaborators in last 48 months

Collaborators who haved worked on a publication with S. M. White in the last 48 months are: M. R. Kundu, J. Brosius, S. K. Solanki, M. Loukitcheva, A. Nindos, G. Nita, K. Shibasaki, J. Lee, Z. Mikić, G. Nita, J. Zhang, D. E. Gary, K. D. Leka, T. Bastian, G. Hurford, J. Chapman, B. Koribalski, L. Sui, S. Krucker, R. P. Lin.

Ph. D. Thesis Advisor

D. B. Melrose, University of Sydney

Students

Jie Zhang, University of Maryland, 1998-2000

PRINCIPAL INVESTIGATOR: Stephen M. White

Current Support: (as Principal Investigator)

- Source of Support: NJIT subcontract from an NSF ATI grant Project Title: "Broadband RF Transmission Characterization and Phase Stabilization for FASR" Total Award Amount: \$121906 Period Covered: 09/01/04 – 08/31/07 Committment of P.I. to this project: 0.24 MY
- Source of Support: NASA SEC GI program Project Title: "X-ray and Radio/Millimeter Images of High Energy Electrons in Solar Flares" Total Award Amount: \$175265 Period Covered: 01/01/05 - 12/31/07 Committment of P.I. to this project: 0.33 MY
- 3. Source of Support: NASA LWS TR&T program Project Title: "The Green Bank Solar Radio Burst Spectrometer: A Resource for LWS Studies" Total Award Amount: \$119339 Period Covered: 05/24/06 - 5/23/09 Committment of P.I. to this project: 0.21 MY

Current Support: (as Co-Investigator)

None. Additional support is received from the College Park Scholars program and the CARMA project.

Pending Support: (as Principal Investigator)

 Source of Support: NASA LWS TR&T Program Project Title: "Coronal Magnetic Fields from Radio Observations" Total Award Amount: \$204716 Period Covered: 05/01/08 - 4/30/11 Committment of P.I. to this project: 0.33 MY

Pending Support: (as Co-Investigator)

None.

Curriculum Vitae: Thomas H Zurbuchen

Birth Date:	1968, Habkern, Switzerland	
Marital Status	: Married, two children	
Education:	Ph.D., Physics (with highest honors), University of Bern, Switzerland, 1996	
	M.S. Physics, Mathematics, and Astronomy (with highest honors), University of Bern, Switzerland, 1992	
Employment:		
2007 – present 2003 – present 2002-2003 6-7/2000, 7/2001	Director, Center for Entrepreneurship, College of Engineering, UM Associate Professor, University of Michigan enior Associate Research Scientist, University of Michigan enior research scientist, International Space Science Institute (ISSI),	

6-7/2000, 7/2001	Senior research scientist, International Space Science Institute (ISS	
	Bern, Switzerland	
1998-2002	Assistant Research Scientist, University of Michigan	
1996-98	Research Fellow, University of Michigan	
1992-94	Consultant in Space Industry, Oerlikon Contraves, Switzerland	
1990-92, 1994-96	Research Assistant, University of Bern	
1990–92, 1994-96	Teaching Assistant, University of Bern	

Professional Societies:

American Astronomical Society (AAS) American Geophysical Union (AGU) American Society for Engineering Education (ASEE) International Society for Optical Engineering (SPIE)

Awards:

2006	NASA Group Achievement Award, Ulysses Mission
2005	UM College of Engineering 2005 Service Excellence Award
2004	National Science and Technology Council (NSTC) Presidential Early Career for
	Scientists and Engineers (PECASE) Award.
2001	Research Scientist Excellence Award, University of Michigan, College of
	Engineering
1996-1997	Swiss National Science Foundation, Young Researcher Award
